

# About this presentation (inserted post-talk)

These are the slides for a presentation given by Mary Gardiner at the Open Source Developers' Conference in Melbourne Australia in December 2006.

The slides were produced by  $\text{\LaTeX}$  using the Beamer class, available from <http://latex-beamer.sourceforge.net/>. Presentation source is available via Bazaar from <http://users.puzzling.org/users/mary/bzr/OSDC+2006/>

This work is licensed under the Creative Commons Attribution-ShareAlike 2.5 License. To view a copy of this license, visit <http://creativecommons.org/licenses/by-sa/2.5/>

## Disclaimers (inserted post-talk)

The Planet symbol used in this talk is actually the web-browser.svg image from the Tango icon theme, which is available under the Creative Commons Attribution-ShareAlike 2.5 License Agreement from <http://tango.freedesktop.org/>. It isn't normally used by the Planet project.

The hackergotchi heads used in this presentation are those of Mary Gardiner and Andrew Bennetts with an assortment from <http://planet.gnome.org/heads/>

All smack about Planet v Venus is pure hyperbole.

# Outline

- 1 **About Planet**
- 2 Some history
- 3 Making a good Planet
- 4 The software
- 5 The end

# Planet: a conceptual overview

# Planet: definition 1

Planet *proper noun*

A piece of software written in Python, which aggregates syndication feeds and outputs a text document, usually a web page.

Sample usage: “How do I install Planet?” “Why does Planet use so much memory?”

# Planet: definition 2

Planet *proper noun*

A webpage that has been produced by the Planet software.

Sample usage: “I want to run a Planet.” “I saw that on Planet Debian.”

## KDE vs. GNOME: Memory Use

About a week ago Quim put out a [call](#) for better profiling of whole-desktop resource use. This isn't it, but it is a start. Consider it more of an update of Lubos Lunak's [comparison](#) from GNOME 2.14 vs. KDE 3.5.2. In that comparison KDE won by tens of megabytes.

I have cooked up a perl [script](#) that wakes up every 30 seconds, takes a look at what is going on and writes it out to a log file. The most interesting parameters it currently records are the total memory use (equivalent to what free returns on the `./+ buffers` line). Be warned that the script is currently completely undocumented and you will have to read the source to find out where the default log file goes and how to change that. It is also completely Linux specific. I am also deeply suspicious of some of the data it returns. Most definitely a work in progress, but I couldn't give the results below and keep it hidden.

I am far from certain that everything is being done in the best possible way. For example look at Lubos' [comparison](#) for a discussion for reasons why free isn't necessarily a good measure of memory use; this script uses the same approach as free. On top of this I have no real indication of the uncertainty in these results. Finally, I did things a bit differently from Lubos so direct comparison with his numbers is impossible.

## Andreas Barth

### More bugs need to go away

On Monday, I sent out the next release update (which was under preparation for a few days). Basically, Debian is doing quite well - we just have a few items left open before we can have the full freeze.

Of course, I worked also on one of the preconditions, namely on RC bugs - the usual trying to reproduce, uploading fixes, encouraging other people to upload fixes, easing testing transition, ...

09:14am

## Jeff Bailey

### And a good time was had!

On our third attempt to finally get everything signed, we got all the paperwork done for buying a place today! It's silly how much everyone seemed to expect that we knew the whole process and would get impatient with us not having something ready that we hadn't a clue was even required.

I've updated our address in Orkut. I'll do the Debian database and other things when I can remember just how those get done. =)

This evening, we decided that we needed to go over and spend some time in the place, so we had Brad, Jody, me, Angie, Simon, Alison, and Damien over for chips, drinks, pizza and cookies.

Now the moving fun begins, and we still get to try and find a tenant. Whee!

## Hackergotchi

From Wikipedia, the free encyclopedia

A **hackergotchi** is a picture of a writer used as an [avatar](#) to identify the author of a given [RSS](#) feed in [blog aggregators](#).

**Contents** [\[hide\]](#)

- 1 Origin
- 2 Types
- 3 Drop shadows
- 4 Creation
- 5 External links
- 6 Tutorials

### Origin

The term *hackergotchi* originated when the fashion of blog aggregators hit the [hacker](#) community, hence the "hacker" part.

**Jakub Steiner**, a [GNOME](#) artist, had created several whole body cutouts that originally appeared on the [Art.GNOME.org](#) website. A couple of years later, [Jeff Waugh](#) launched [Planet GNOME](#)<sup>[1]</sup>, a blog aggregator of GNOME programmers and contributors. Luke Stroven suggested that Jeff use the images created by Steiner with posts by those writers. Stroven then created a bunch of images that depicted the heads of people on Planet GNOME. Waugh coined the term *hackergotchi* after seeing the collection of heads Stroven created.

The "gotchi" part seems to be a reference to the [Tamagotchi](#) toy.

## Planet aggregator

From Wikipedia, the free encyclopedia

The introduction to this article provides **insufficient context** for those unfamiliar with the subject matter.

Please help Wikipedia by improving the introduction according to the guidelines laid out at [Wikipedia:Guide to layout](#). You can discuss the issue on the [talk page](#).

In computing, **Planet** is a [FOSS web feed aggregator](#) written in [Python](#) and maintained by [Jeff Waugh](#) and [Scott James Remnant](#). It is [software](#) that runs on a [web server](#), downloading web feeds and aggregating their content together. It then creates [web pages](#) with entries from the original feeds in chronological order, most recent entries first.

It uses [Mark Pilgrim's Universal Feed Parser](#) to process feeds in [RDF](#), [RSS](#) and [Atom format](#), and [Tomas Styblo's HTML::Template templating engine](#) to output static files in any format.

The concept behind Planet is becoming broader than the original application as other similar projects appear, implemented with the use of other [programming languages](#); examples include [MetaPlanet](#) [↗](#), written in [PHP](#).

Aggregated sites powered by Planet are also called "planets" and often contain the "Planet" moniker in their names. These planets are often built from the [weblogs](#) of members of a specific group or clique, e.g. "Planet Debian", created from the feeds of weblogs by people active in the [Debian](#) community.

### Example planets

- [Planet Debian](#) [↗](#) – Debian developers
- [Planet GNOME](#) [↗](#) – GNOME developers
- [Planet KDE](#) [↗](#) – KDE developers

## Making software path-relocatable

Posted 14 Aug 2000 by [matt](#)

How many pieces of software on your system, if you woke up tomorrow and said "hmm, I think these packages should live in /foo, not /bar", would need to be recompiled from source? What can we do about it?

[Read more...](#) (8 replies)

## Programming Languages of Choice

Posted 14 Aug 2000 by [Uruk](#)

Languages are very interesting things. They can either tie you up, or set you free. But no programming language can be everything to everyone, despite the fact that sometimes it looks like one does.

[Read more...](#) (4 replies)

## Version Control Systems: The Next Generation

Posted 14 Aug 2000 by [Simon](#)

I'm building a new version control system, and I need input from people I want to use it: people like you. If we're going to get version control right, how should we do it?

Welcome to Advogato, the free software developer's advocate. The goal of the site is to serve as a community resource for free software developers around the world, as well as a research testbed for work on group trust metrics.

Here's the [mission statement](#).

Curious how the [trust metric](#) works?

3:10 PM

This is to remind me that I unregistered the dll files pointing to serverA and registered a new set of dlls pointing serverB. Once I'm done with serverB, I should unreg and reg the dlls to its original server.

12:19 AM

Mulad, it's true, DOS shell is gone--kaput. It's probably the Win2K install program, it took away the DOS shell. Dang it, this is bad. Now, I'll have to get me a laptop.

11:28 AM

My goodness! They took away DOS shell in Win2K. How will I play with gcc and nasm on Win32 now? My bad! MS, what have they done with DOS shell!?

8:42 AM

Next time, I should be very careful when mentioning nasm and gas, as some people are sensitive about it. I guess it was an honest mistake for not including gas in the development environment, but it should be in there too. How can anyone use gcc and not use gas when dealing with low level code. Nasm is good but gas is inescapable.

Hmm, my suspicions were correct. KDE has realized they need to market themselves to the public. This is going to be fun to watch.

`devel@lists.planetplanet.org` list.

... so is support.

See <http://www.planetplanet.org/> for the mailing lists and  
Bazaar branches.

... except for Venus (more soon)

# Technical details

Planet is:

- written in Python;
- based on Feed Parser, by Mark Pilgrim and Sam Ruby:  
<http://www.feedparser.org/>; and
- uses htmltmpl (<http://htmltmpl.sourceforge.net/>) (or XSLT) for templating.

# Technical challenges

Planet is a pain because:

- htmltmpl doesn't stream (read: memory woes);
- the original maintainers ran it on a well equipped machine (read: memory woes);
- the original codebase isn't well tested (read: maintainence woes);
- for a long time it used bsddb (read: crazy woes); and
- people keep writing their own feed generators with a variety of entertaining mistakes, particularly in date stamping (general woes of all kinds).
